### Types of Protein Post-Translational Modification

Post-translational modification (PTM) of proteins refers to the chemical changes that occur after a protein has been produced. It can impact the structure, electrophilicity and interactions of

### Posttranslational Modification - an overview ...

Methylation is the addition of the methyl group to the lysine side chain responsible for chromatin transcription activity state. Sulfation is a permanent post- translational modification needed for the functioning of the proteins. Ubiquitination is another major post-translational modification that has a major role in protein degradation. Small ubiquitin-related modifiers are responsible for SUMOylation.

### Post-Translational Protein Modification - an overview

...

Joshua Long, Sahir Kalim, in *Advances in Clinical Chemistry*, 2018. 8 Conclusion. Decades of research have coalesced to demonstrate protein carbamylation is a post-translational protein modification that occurs ubiquitously in humans and can increase through a variety of pathways including kidney disease, smoking, air pollution, and diet. Carbamylated proteins can undergo changes in charge, structure, and function, resulting in molecular and cellular dysfunction.
