A cellular automaton is a self mapping of the set of configurations of a group defined from local and invariant rules. Cellular automata were first only considered on the n dimensional lattice group [equation]

The Nature of Code

A cellular automaton is a model of a system of cell objects with the following characteristics. The cells live on a grid. (We'll see examples in both one and two dimensions in this chapter, though a cellular automaton can exist in any finite number of dimensions.)

Cellular Automaton Practice Problems Online | Brilliant

Cellular automata are a type of system that takes Feynman's doctrine to the extreme, unfolding in time according to a set of update rules that can be listed on a table. Each colored square simply looks at itself and each of its neighbors, and uses the information on the table to update its color.
