[OXYGEN TRANSPORT](#). The oxygen that we obligate aerobes need for survival is transported from the lungs to peripheral tissues by the hemoglobin that is densely packed in our red blood cells (erythrocytes). Hemoglobin is the most intensively studied protein in the world, and its structure is known in intimate detail. It is made up of four protein subunits. Normal human adult hemoglobin A is a tetramer comprised of a pair of alpha-globin chains and a pair of beta-globin chains. Nestled deep in
