## Somite - Wikipedia

Somites (outdated: primitive segments) are divisions of the body of an animal or embryo. The divisions are also known as metameric segments. Somites are bilaterally paired blocks of paraxial mesoderm that form in the embryonic stage of somitogenesis, along the head-to-tail axis in segmented animals.

## Segmentation (biology) - Wikipedia

Segmentation in biology is the division of some animal and plant body plans into a series of repetitive segments. This article focuses on the segmentation of animal body plans, specifically using the examples of the taxa Arthropoda, Chordata, and Annelida.

Hector Escriva | Centre National de la Recherche ...

Hector Escriva, Centre National de la Recherche

Scientifique / French National Centre for Scientific

Research, UMR7232 Department, Faculty Member,

Studies Alfred North Whitehead, History of Philosophy of Science, and Theoretical biology.

Alexandre Colas, Ph.D. | SBP

Our laboratory focuses on the identification and reconstruction of novel regulatory pathways controlling the determination and the acquisition of cardiovascular cell fates in humans.

## Faculty & Staff - UW-Green Bay

**Research Interests.** I am interested in conservation applications of terrestrial arthropod assemblages, especially spiders, and have a particular interest in the ecology and taxonomy of sheet web spiders (family Linyphiidae).

## Molecular control of macroscopic forces drives formation ...

The embryonic gut tube is a cylindrical structure from which the respiratory and gastrointestinal tracts develop 1. Although the early emergence of the endoderm as an epithelial sheet 2,3 and

## Anatomy of Animals - Universe

Bone is the major component of the skeletons in adult vertebrates. It is composed of both living tissues, such as bone cells, fat cells, and blood vessels, and nonliving materials (such as collagen) secreted by the bone cells called osteoblasts into the inter-cellular space.

## OMIM Entry - \* 601090 - FORKHEAD BOX C1; FOXC1

The mouse gene MFI, which encodes a forkhead/winged helix transcription factor expressed in many embryonic tissues, including prechondrogenic mesenchyme, pericardial mesenchyme, meninges, endothelial cells, and

kidney, is the mouse homolog of FOXCL1.

**MIB1 | Cancer Genetics Web**

Pheochromocytomas and paragangliomas are rare, neural crest-originating, neuroendocrine tumors. HuR is an mRNA-binding protein of the ELAV/Hu-protein family, which participates in posttranscriptional regulation of many cancer-associated genes.

**TP53 | Cancer Genetics Web**

The TP53 gene remains the most frequently altered gene in human cancer, of which variants are associated with cancer risk, therapy resistance, and poor prognosis in several tumor types.
