[A simple VSWR analysis without mirrors - owenduffy.net](#)

So now we have two waves traveling in opposite directions. Their phase relationship changes along a long

line, and at some points, V_{wd} is in phase with V_{ref} , so they reinforce and the maximum voltage is $100+50=150\text{V}$, and at other points they oppose and the minimum voltage is $100-50=50\text{V}$. The ratio of this maximum to minimum voltage is known as the VSWR and in this example is 3, often written as

Component Addition - physicsclassroom.com

The side opposite the 30° angle is the horizontal side; the horizontal side represents the horizontal (westward) component of $C - C_x$. The values of C_x and C_y can be determined by using SOH CAH TOA. The cosine function is used to determine the southward component since the southward component is adjacent to the 30° angle. The sine function is used to determine the westward component since
